Ø 003/029

Amendments to the Claims

- 1. (currently amended) An integrated circuit comprising:
 - a semiconductor substrate;
 - a buried insulation layer directly over the semiconductor substrate;
 - a semiconductor mesa over the buried insulation layer; and,
- a guard ring substantially surrounding the semiconductor mesa, wherein the guard ring extends through the buried insulation layer contacting the semiconductor substrate, and wherein the guard ring is arranged to provide RF isolation for the semiconductor mesa.
- 2. (original) The integrated circuit of clalm 1 wherein the semiconductor substrate comprises a high resistivity semiconductor substrate.
- 3. (original) The integrated circuit of claim 1 wherein the semiconductor substrate comprises a silicon substrate, wherein the buried insulating layer comprises a buried silicon oxide layer, and wherein the semiconductor mesa comprises a silicon mesa.
- 4. (original) The integrated circuit of claim 3 wherein the silicon substrate comprises a high resistivity silicon substrate.
- 5. (original) The integrated circuit of claim 1 wherein the semiconductor substrate is doped in an area that is contacted by the guard ring.

6, (original) The integrated circuit of claim 5 wherein the semiconductor substrate comprises a

high resitivity semiconductor substrate.

7. (original) The integrated circuit of claim 5 wherein the semiconductor substrate comprises a

silicon substrate, wherein the buried insulating layer comprises a burled silicon oxide layer, and

wherein the semiconductor mesa comprises a silicon mesa.

8. (original) The integrated circuit of claim 7 wherein the silicon substrate comprises a high

resisitivity silicon substrate.

9. (original) The integrated circuit of claim 1 further comprising an insulating ring between the

guard ring and the semiconductor mesa, wherein the insulating ring surrounds the semiconductor

mesa.

10. (original) The integrated circuit of claim 9 wherein the semiconductor substrate comprises a

high resistivity semiconductor substrate.

11. (original) The integrated circuit of claim 9 wherein the semiconductor substrate comprises a

silicon substrate, wherein the buried insulating layer comprises a buried silicon oxide layer, wherein

the insulating ring comprises a silicon oxide insulating ring, and wherein the semiconductor mesa

comprises a silicon mesa.

2005/029

- 12. (original) The integrated circuit of claim 11 wherein the silicon substrate comprises a high resistivity silicon substrate.
- 13. (original) The integrated circuit of claim 9 wherein the semiconductor substrate is doped in an area that is contacted by the guard ring.
- 14. (original) The integrated circuit of claim 13 wherein the semiconductor substrate comprises a high resistivity semiconductor substrate.
- 15. (original) The Integrated circuit of claim 13 wherein the semiconductor substrate comprises a silicon substrate, wherein the buried insulating layer comprises a buried silicon oxide layer, wherein the insulating ring comprises a silicon oxide insulating ring, and wherein the semiconductor mesa comprises a silicon mesa.
- 16. (original) The integrated circuit of claim 15 wherein the silicon substrate comprises a high resistivity silicon substrate.
- 17. (original) The integrated circuit of claim 1 wherein the guard ring comprises a low resistivity guard ring.
- 18. (original) The integrated circuit of claim 1 wherein the guard ring comprises a metal guard ring.

McDonnell Boehnen Hulbert & Berghoff LLP 300 South Wacker Drive Chicago, IL 60606 Telephone: (312) 913-0001

2006/029

- 19. (original) The integrated circuit of claim 18 wherein the metal guard ring comprises a tungsten guard ring.
- 20. (withdrawn) An integrated circuit comprising:
 - a semiconductor substrate;
 - a buried insulation layer over the semiconductor substrate;
 - a first semiconductor mesa over the buried insulation layer;
 - a second semiconductor mesa over the buried insulation layer;
- a first guard ring substantially surrounding the first semiconductor mesa, wherein the first guard ring is in contact with the semiconductor substrate, and wherein the first guard ring is arranged to provide RF isolation for the first semiconductor mesa; and,
- a second guard ring substantially surrounding the second semiconductor mesa, wherein the second guard ring is in contact with the semiconductor substrate, and wherein the second guard ring is arranged to provide RF isolation for the second semiconductor mesa.
- 21. (withdrawn) The integrated circuit of claim 20 further comprising a third guard ring between the first and second guard rings, wherein the third guard ring is in contact with the semiconductor substrate, and wherein the third guard ring is arranged to provided further RF isolation for the first and second semiconductor mesas.

McDonnell Boehnen Hulbert & Berghoff LLP 300 South Wacker Drive Chicago, IL 60606 Telephone: (312) 913-0001 McDONNELL BOEHNEN **2**007/029

(withdrawn) The integrated circuit of claim 21 wherein the semiconductor substrate 22.

comprises a high resistivity semiconductor substrate.

11/16/2006 13:24 FAX 312 913 0002

(withdrawn) The integrated circuit of claim 21 wherein the semiconductor substrate 23.

comprises a silicon substrate, wherein the buried insulating layer comprises a buried silicon oxide

layer, wherein the first semiconductor mesa compromises a first silicon mesa, and wherein the

second semiconductor mesa comprises a second silicon mesa.

(withdrawn) The integrated circuit of claim 21 wherein the semiconductor substrate is doped 24.

in a first area that is contacted by the first metal guard ring, wherein the semiconductor substrate is

doped in a second area that is contacted by the second metal guard ring, and wherein the

semiconductor substrate is doped in a third area that is contacted by the third metal guard ring.

(withdrawn) The integrated circuit of claim 21 further comprising first and second insulating 25.

rings, wherein the first insulating ring surrounds the first semiconductor mesa and is between the

first metal guard ring and the first semiconductor mesa, and wherein the second insulating ring

surrounds the second semiconductor mesa and is between the second metal guard ring and the

second semiconductor mesa.

(withdrawn) The integrated circuit of claim 25 wherein the semiconductor substrate is doped 26.

in a first area that is contacted by the first metal guard ring, and wherein the semiconductor

substrate is doped in a second area that is contacted by the second metal guard ring.

McDonnell Boehnen Hulbert & Berghoff LLP 300 South Wacker Drive

21008/029

McDONNELL BOEHNEN

27. (withdrawn) The integrated circuit of claim 21 wherein the first guard ring comprises a first low resistivity guard ring, wherein the second guard ring comprises a first low resistivity guard ring,

and wherein the third guard ring comprises a third low resistivity guard ring.

28. (withdrawn) The integrated circuit of claim 21 wherein the first guard ring comprises a first

metal guard ring, wherein the second guard ring comprises a second metal guard ring, and wherein

the third guard ring comprises a third metal guard ring.

29. (withdrawn) The integrated circuit of claim 28 wherein the first metal guard ring comprises a

first tungsten guard ring, wherein the second metal guard ring comprises a second tungsten guard

ring, and wherein the third metal guard ring comprises a third tungsten guard ring,

30. (withdrawn) The integrated circuit of claim 21 wherein the first semiconductor mesa is part

of a sub-circuit, wherein the sub-circuit includes one or more other semiconductor mesas, wherein

the first semiconductor mesa and the one or more other semiconductor mesas are individually

surrounded by the first guard ring, and wherein the third guard ring surrounds the first guard ring.

31, (withdrawn) The integrated circuit of claim 20 wherein the semiconductor substrate is doped

in a first area that is contacted by the first guard ring, and wherein the semiconductor substrate is

doped in a second area that is contacted by the second guard ring.

11/16/2006 13:24 FAX 312 913 0002 McDONNELL BOEHNEN 2009/029

32. (withdrawn) A method of RF isolating a semiconductor feature of an integrated circuit

comprising:

forming a buried insulation layer over a semiconductor substrate;

forming a semiconductor feature in one or more semiconductor layers so that the

semiconductor feature is formed over a portion of the buried insulation layer, wherein the buried

insulating layer has a trench therethrough down to the semiconductor down to the semiconductor

substrate that substantially encloses the portion of the buried insulation layer, wherein the one or

more semiconductor layers has a trench therethrough that substantially encloses the semiconductor

feature, and wherein the trench through the one or more semiconductor layers substantially aligns

with the trench through the buried insulating layer; and,

filling the trench through the one or more semiconductor layers and the trench through the

buried insulating layer with conducting material having low resistivity so that a conductive guard ring

substantially surrounds the semiconductor feature.

33. (withdrawn) The method of claim 32 wherein the semiconductor substrate comprises a high

resistivity semiconductor substrate.

34. (withdrawn) The method of claim 32 further comprising doping an area of the semiconductor

substrate that is contacted by the conductive guard ring.

35. (withdrawn) The method of claim 32 further comprising forming an insulating ring

surrounding the semiconductor feature such that the insulating ring is between the conductive guard

ring and the semiconductor feature.

36. (withdrawn) The method of claim 32 wherein the semiconductor feature comprises a first

semiconductor feature, wherein the portion of the buried insulation layer comprises a first portion of

the buried insulation layer, wherein the trench through the buried insulating layer comprises a first

trench through the buried insulating layer, wherein the trench through the one or more

semiconductor layers comprises a first trench through the one or more semiconductor layers, and

wherein the conductive guard ring comprises a first conductive guard ring, the method further

comprising:

forming a second semiconductor feature in the one or more semiconductor layers so that the

second semiconductor feature is formed over a second portion of the buried insulation layer, wherein

the buried insulating layer has a second trench therethrough down to the semiconductor substrate

that substantially encloses the second portion of the buried insulation layer, wherein the one or more

semiconductor layers has a second trench therethrough that substantially encloses the second

semiconductor feature, and wherein the second trench through the one or more semiconductor

layers is substantially aligned with the second trench through the buried insulating layer; and,

· filling the second trench through the one or more semiconductor layers and the second

trench through the buried insulating layer with conducting material having low resistivity so that a

second conductive guard ring substantially surrounds the second semiconductor feature.

(withdrawn) The method of claim 36 further comprising forming a third conductive guard ring 37.

between the first and second conductive guard rings, the third conductive guard ring being in contact

with the semiconductor substrate.

(withdrawn) The method of claim 32 further comprising grounding the conductive guard ring. 38.

(withdrawn) An integrated circuit comprising: 39.

a semiconductor substrate, the semiconductor substrate forming a first semiconductor layer;

a semiconductor feature formed in a second semiconductor layer, wherein the second

semiconductor layer is over the first semiconductor layer; and,

a guard ring substantially surrounding the semiconductor feature, wherein the guard ring is in

contact with the semiconductor substrate, and wherein the guard ring is arranged to provide RF

isolation for the semiconductor feature.
